

Below is your complete guide to aiding us in cockroach treatment. Our ability to provide a complete treatment and control the cockroach infestation weighs heavily on your cooperation in following this specific list. If not followed, the treatment may be postponed, unsuccessful, or be subject to additional fees. Success is greatly dependent on you.

Preparation

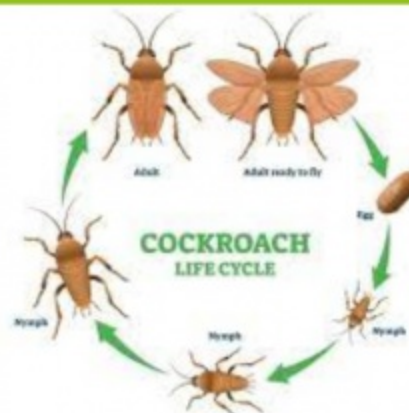

- 🕒 **Clean:** Clean the home prior to your scheduled visit, especially the kitchen! This helps in eliminating competing sources of food. When the home is clean, roaches will be more attracted to the bait which is placed to eliminate them.
- 🕒 **Clutter:** Declutter and organize the space to be treated and throw away any unnecessary items. Seal and store any open food. Remove food, appliances, and other small items from your countertop. Discard any excess paper products and trash. Remove any personal items which create clutter.
- 🕒 **Cupboard and Cabinets:** Remove dishes, food, and other items from cabinets and cover them with a towel or sheet. This includes pet dishes from the floor.
- 🕒 **Vacuum/scrub:** Vacuum any particles or small debris in cabinets, shelves and floor. After vacuuming, take vacuum bag outside, seal it, and discard in trash. Wipe down vacuum with damp cloth. Mop/scrub floors. Wipe all surfaces with a disinfectant.
- 🕒 **Prepare to leave:** Arrangements must be made for occupants and pets to vacate during the treatment process for four hours, including all pets.

Treatment

- 🕒 **Treatment:** EPA-approved materials including dust, liquid sprays, baits, and aerosols will be applied.
- 🕒 **Time frame:** This visit takes roughly one-two hours

After Treatment

- 🕒 **Re-entry:** Occupants and pets can return four hours after treatment; fish and reptile tanks must be thoroughly washed before pets are returned to them unless covered prior to treatment.
- 🕒 **Restocking:** Insure that treated surfaces are dry before returning items to shelves and cupboards. Do not remove, touch, or clean baits or IGR devices, and DO NOT attempt to self-treat. Sticky traps can be used for monitoring.
- 🕒 **Ventilation:** If an odor is noticed, you can ventilate the area by opening doors and windows temporarily.
- 🕒 **Cockroach activity:** You will likely see some activity after treatment. Because of their exposure to pesticides, any remaining won't be able to reproduce and will die soon.
- 🕒 **Follow-up treatment:** Follow-up treatment is recommended to break life cycle.

Prevention Tips

- 🕒 **Cleanliness:** Keep sanitation at a very high level to allow products to work as quickly as possible. Keep clutter to a minimum.
- 🕒 **Garbage:** Take garbage out every night and always keep in closed containers.
- 🕒 **Repairs:** Repair any water leaks immediately upon detection.
- 🕒 **Food:** Continue to keep all food sealed in closed containers.
